

SOV/122-59-4-6/28

A Series of Broad V-Belts for Infinitely Variable Speed  
Transmissions

with cross-sections tabulated in Table 1 amounts to 340.  
The series of lengths approved for production is shown in  
Table 2. The maximum power transmitted by the belt  
section at a speed of 20 m/sec is given in Table 3. At  
5 m/sec belt speed, a correction coefficient of 0.31 is  
applied; at 30 m/sec, a coefficient of 0.72.

TITLE        New Construction of a Thermomagnetic Gas Analyzer Based Upon Oxygen.  
              (Novaya Konstruktsiya termomagnitnogo gazoanalizatora na kislorod-  
              -Russian)  
PERIODICAL   Zavodskaya Laboratoriya, 1957, Vol 23, Nr 7, pp 852-858 (U.S.S.R.)  
ABSTRACT     This device consists of a principal component(indicator) in which measuring of thermal magnetic convection is carried out, the electric elements being fitted to the interior of the lid. Inside there is a thermostatic cell with a magnetic system and measuring chamber with sensitive elements through which the gas to be analyzed passes. The device has a permanent magnet. (made of "magniko" alloy), the magnetic conductor is made of "armko" iron, and the pole points made of "permendur" serve for the maintenance of a maximum field voltage. The magnetic system has "gabarites" having a great stability of magnetic field voltage as well as a hermetically closed chamber the interior of which is coated with lead. The indicator possesses two sensitive elements in the measuring chamber each having two heaters as extensions of the magnetic bridge. Here the position of the sensitive elements as well as that of the heater are fixed in proportion to the magnetic pole. By an increase of the oxygen content of the gas mixture thermomagnetic convection is increased. By means of this device it is thus possible to determine the number of oxygen molecules in the gas volume unit of the measuring chamber. In this way also partial pressure is determined.

ORG: Far East Central Experimental Station (Dal'nevostochnaya tsentral'naya eksperimental'naya baza)

TITLE: Deep-sea twin-rig catch [Fishing net towed by two vessels]

SOURCE: Rybnoye khozyaystvo, no. 11, 1966, 46-48

TOPIC TAGS: trawler, fishing ship, research ship, research ship instrumentation/SRTR Shedar ship, SRTR Kastor ship, SRTR-400 ship

ABSTRACT: In 1965 the Far East Central Experimental Station tested experimental methods for fishing at 700 to 1000 m depths using two sets of coupled cables to pull the net. The rig, drawn between two ships, has 500-kg weights at each cable coupling and carries 50-kg side weights. The experiment was initially conducted from the trawlers SRTR "Kastor" and SRTR "Shedar," which were later replaced by the SRTR-400, a much improved ship. Trawlers participating in deep-sea fishing must be equipped with EGA-10 "Kal'mar" echo depth finders and with pneumatic line throwers. The ships work in pairs, one of each pair carrying a KPI-3M locator instrument. Orig. art. has: 3 figures.

In the acute state of rheumatism, increased general, cardiovascular and combined reactions to streptovaccine with relatively mild cutaneous inflammatory reaction are observed. Proliferative stage of rheumatic process is accompanied by

31/49T29

USSR/Medicine - Rheumatism, Etiology Nov 48

and Pathogenesis (Contd)

Pronounced local cutaneous inflammatory reaction to streptovaccine. In the cicatric stage characterized by rheumatic nodules, there is a slight decrease in all types of rheumatic allergy. Allergy tends to reappear in postrheumatic period. Relapses and long duration of rheumatic affliction increase allergy. Sodium salicylate lowers the anaphylactic manifestations in rheumatic allergy. Streptovaccine lowers inclination of the rheumatic patient to hyperergic inflammation but at the same time increases his anaphylactoid reactivity.

yavleniya v poluprovodnikakh, Kiev, AN UkrSSR, 1959,  
398-400)

TEXT: Preliminary experiments on gamma-ray detection by photoresis-  
tors are described, conducted in order to determine the possibili-  
ties of applications in defectoscopy, thickness control etc. Co60  
gamma-rays were directed upon a thallium activated sodium or cesium  
iodide crystal and the emitted light was focussed onto the photore-  
sistor. The photocurrent was recorded using a single-valve ampli-  
fier. The dependence of the sensitivity of the method upon the thick-  
ness of the absorbing material was investigated. Best results were  
obtained using monocrystalline photoresistors type ФСК-М1 (FSK-MI)

In a number of cases the sensitivity was increased by using additional constant illumination of the photoresistor provided by a special lamp. It is pointed out that it is necessary to increase the sensitivity and reduce the inertness of the photoresistors. [Abstract's note: Complete translation].

TITLE: Control of Flights on the Bombing Range (Rukovodstvo poletami na poligonakh)

PERIODICAL: Vestnik Vozdushnogo Flota, 1958, Nr 1, pp. 40-44 (USSR)

ABSTRACT: The article deals with the control of flights on the bombing range. The author begins his article by indicating who, according to the manual, can be assigned to supervise the flights on the bombing range. Then he mentions that the Air Force bombing ranges are divided into several categories. A detailed description of the command post equipment on the bombing range is given. Particular attention is paid by the author to the selection of the location of radar stations and to the identification of air crews over the bombing range. This is followed by the description of work sequence of air crews over the bombing

TITLE:

Comparability of the Wind-velocity Values Calculated by the Data of the Anemometer With Those Observed by Means of an Anemoscope (Sravnimost' rasschitannykh velichin skorosti vетра po dannym anemometra s nablyudennymi po flyugeru)

PERIODICAL:

Meteorologiya i gidrologiya, 1959, Nr 8, pp 37-38 (USSR)

ABSTRACT:

In the investigation carried out here, the data of two stations - Voyeykovo and Yerbent (peski Karakumy) - with climatically and physical-geographically completely different conditions were used. They are data from simultaneous observations of wind velocities at different altitudes: in the first place at an altitude of 1, 3 and 11 m, and in the second place at an altitude of 3 and 11 m. In Voyeykovo, the measurements were carried out by a hand anemometer at the first two altitudes, and by an anemoscope on the third level. In Yerbent, the measurement was made by a hand anemometer on the lower level, and by an anemoscope on the upper one. About 200 observation series were carried out in each place. The observation material investigated showed that in both places there were great differences between

Card 1/2

SOV/50-59-8-13/19

Comparability of the Wind-velocity Values Calculated by the Data of the Anemometer With Those Observed by Means of an Anemoscope

the values obtained for the wind velocity on the 11-m level by anemoscope, and those calculated on the basis of anemometer indications at an altitude of 1 and 3 m. The amount of error in the values calculated depends on the wind character and the wind velocity, this dependence being different for places with different climatic and physical-geographical conditions.

glushby  
 Ed. (title page): S.I. Pirovarova, Candidate of Geographical Sciences;  
 Ed. (inside book): Ye. I. Oksenova; Tech. Ed.: A.P. Shumikhin.

PURPOSE: This collection of articles is intended for meteorologists  
 serving with the hydrometeorological network in the Soviet Union.

COVERAGE: The publication contains scientific articles on the methods  
 of meteorological observations and on the procedure of testing  
 meteorological instruments. The possibility of reducing the errors  
 and thus securing more accurate results in observations are shown  
 by mathematical computations and graphs. The need for a universal  
 portable instrument that would be capable of instantly recording  
 cloud height is emphasized. The articles are accompanied by  
 maps, diagrams, tables and references.

AUTHOR: Vorob'yev, I. Ye.

TITLE: A Nephoscopic Method of Determining Cloud Height (Nefoskopicheskiy metod opredeleniya vysoty oblakov)

PERIODICAL: Trudy Glavnay geofizicheskoy observatorii, 1957, Nr 72, pp. 134-138  
(USSR)

ABSTRACT: A nephoscopic method for measuring cloud height under stable weather conditions, based on the law of logarithmic distribution of wind velocity with height, is described. It consists in the following: after determining the amount of time (t) it takes a cloud to pass between the teeth of a nephoscope, and the position of the nephoscoped cloud over the horizon and the velocity of surface wind (v), the height of the nephoscoped cloud is determined according to a table worked out on the basis of the following two formulas:

$$u = u_1 \frac{\log z - \log z_0}{\log z_1 - \log z_0}, \quad (1)$$

where  $u$  = wind velocity at a given height;  $u_1$  = wind velocity determined by a weather vane;  $z$  = a given height;  $z_1$  = height of a weather vane, 12 m;  $z_0$  = coefficient of roughness, 0.05 m;

Card 1/2

36-72-12/13

**A Nephoscopic Method of Determining Cloud Height. (Cont.)**

$$t = \frac{nN}{10v}$$

where  $t$  = time it takes a cloud to pass between the teeth of a nephoscope;  $n$  = number of teeth passed by the nephoscoped cloud;  $N$  = given cloud height;  $v$  = velocity of cloud (wind) at a given height, calculated according to formula (1);  $0.2$  = distance (in meters) from observer's eye level to the point of the nephoscope teeth. The author finds that the nephoscopic method is the most accurate of those available for measuring cloud height under stable weather conditions. The article contains 3 tables. No authors are mentioned.

VOROB'YEV, I. Ye,

"Influence of the Inhomogeneity of Aspiration Within the Psychrometric Box Upon the Readings of Thermometers," Meteorol. i gidrologiya, No 9, 1953, pp 49-50

The temperature of the dry and wet thermometer with a psychrometric box at various parts of the box can differ by 0.2°-0.3°. In particular, the wet thermometer in the windy part of the box indicates a temperature 0.2° lower on the average than in the down-wind part. Thus, rather considerable errors can occur in the determination of the vapor tension (up to 1.2 millibars) and relative humidity (%). (RZhGeol, No 5, 1954)

Text Data

Coverage: This is a very complete atlas of birds found in the Ussuri region of the Maritime Province RSFSR (Primor'ye). Each bird is described in detail, also its ethology, habits, biota, migration, molting, food, roosting, color of feathers, flight, etc., as well as geographic distribution and systematic division. The atlas is supplied with numerous pictures, many of them in color. There is also in some places a short description of the scenery and landscape of

TITLE: On the Biology of Propagation of Some Species of the Arkticheskaya (Arctic) and Amerikanskaya (American) Ornithofauna in North-Eastern Yakutiya (K biologii razmnozheniya nekotorykh predstaviteley arkticheskoy i amerikanskoy ornitofauny v severo-vostochnoy Yakutii)

PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 3, pp. 609-612 (USSR)

ABSTRACT: In summer 1957 the author made an exploring expedition in the mentioned region. The northeastern tundra is difficultly accessible and therefore is a "blank" with respect to animal geography in maps on the subject. In spite of high north latitudes a rich and peculiar fauna was found here. (60 kinds of birds). 31 of these kinds were characteristical for the tundra. Of special interest among them are the Canadian cranes mentioned in the following and the American snipe-like M. griseus scolopaceus which were found for the first time nesting in Yakutiya (in the USSR so far only in the peninsula Chukotka). By the discovery of these two kinds their propagation area is considerably extended to the west, which is very interesting from the point of view of animal geography. Somateria stelleri
